The Problem

- OCC 2026-13 (US, April 2026) and MAS's AI MRM framework (Singapore, December 2024) have diverged in ways that a compliance memo or shared spreadsheet cannot handle — not because the data is too large, but **because the logic differs by jurisdiction:**

Dimension	us OCC 2026-13	sg MAS 2024 / 2025
Local XAI for credit	Not mandated	Required — per applicant
PSI retrain threshold	0.25	0.20
GenAI in scope	Explicitly excluded	Included
Fairness standard	EEOC 4/5ths rule ($DI \geq 0.80$)	FEAT — outcome-based, no threshold
Independent validation	De-emphasised	Required for high-risk AI

The consequence

- A bank governing its credit models under a single framework is either over-compliant in the US or under-compliant in Singapore.
- The governance gap will widen. Both regulators are continuing to move.

A specific example

Our credit model produced a Population Stability Index of 0.22 in Q2.

- Under OCC rules:** monitoring only.
- Under MAS rules:** mandatory retrain review.

Same model. Same number. Different obligations. A spreadsheet applying one jurisdiction's threshold gives the wrong answer for the other, with confidence.

Why a Memo or Spreadsheet Cannot Do This

④ Flag when the same model simultaneously passes in one country and fails in another.

At $PSI = 0.22$, the platform surfaces a **"jurisdiction divergence event"** — not a generic alert, but a named, version-stamped governance action showing which check failed under which config. A memo cannot do this.

A spreadsheet does not know it needs to.

③ Produce jurisdiction-correct outputs from the same underlying analysis.

The same SHAP explanation powers both the CFPB Regulation B adverse action notice (specific written reasons, 30-day deadline) and the MAS FEAT/PDPA notice (meaningful explanation, human oversight attestation).

*Same data source. Different legal formats.
One investment, two regulatory outputs.*

① Apply different rules automatically by jurisdiction.

OCC says $PSI \geq 0.25$ triggers retraining. MAS says $PSI \geq 0.20$. A spreadsheet holds one number.

- The compliance officer decides which to apply — and if they apply the wrong one, the error is **invisible**.

② Survive a regulatory update without rewriting.

- OCC issued Bulletin 2026-13 in April 2026, rescinding SR 11-7. Every institution with compliance logic hard-coded had to **rewrite**.
- ClearPath updated one config file. Historical reports remained valid because each was stamped with the active config version and effective date.

What the Platform Handles

- **Single evaluation engine, dual interpretation. Human judgment gates (explicit, not implicit).**

Capability	Key Output	us OCC 2026-13	sg MAS 2024 / 25
Performance Metrics	AUC 0.92 · Gini 0.84 · KS 0.69 · Brier 0.11 · PR-AUC 0.86 · ECE 0.08	Conceptual soundness — model must be defensible to management	Model quality — metrics must be appropriate and documented for the specific use case
PSI Drift Monitor	Q2 PSI = 0.22 → ⚡ Divergence zone	$\geq 0.25 \rightarrow$ Retrain	$\geq \mathbf{0.20} \rightarrow$ Retrain (tighter)
Fairness — Sex & Age	Sex DI = 1.13 ☒ · DPD = +0.04 ☒ · Age DI = 0.87 ☒	EOCA / Reg B — enumerated classes; 4/5ths rule (DI ≥ 0.80 , reference-group floor)	MAS FEAT — outcome-based; no fixed threshold; >15 pp gap triggers FEAT review (operational threshold)
IV / WoE Analysis	Per-feature information value on all raw inputs	Implied in conceptual soundness	Explicit per-feature justification required (MAS 2024, p. 14)
Explainability — SHAP + LIME	Global summary (portfolio) + local waterfall (per applicant) + LIME independent check	Global: supports conceptual soundness · Local: not mandated under OCC 2026-13	Global + local: both required for credit · LIME satisfies FEAT Transparency T2
Adverse Action Notices	Two jurisdiction-correct drafts from the same SHAP attribution	CFPB Reg B § 1002.9 — specific written reasons, 30-day deadline	MAS FEAT + PDPA Advisory Guidelines — meaningful explanation + human oversight attestation

What the Platform Handles

- Single evaluation engine, dual interpretation. Human judgment gates (explicit, not implicit).

D. Jurisdiction Decision Matrix

Check	US (OCC 2026-13)	SG (MAS 2024/25)	Divergence?
Gini $\geq$ threshold	PASS	PASS	Low
KS $\geq$ threshold	PASS	PASS	Low
PSI latest	FAIL (RETRAIN) (PSI=2.	FAIL (RETRAIN) (PSI=2.	Medium
Fairness (Sex DI)	FAIL (DI=0.796 < 0.8)	PASS (FEAT gap=0.080)	HIGH
Local XAI	N/A (not required)	PASS	HIGH
Indep. Validation	N/A (de-emphasised)	WARN: Required — confi	HIGH
GenAI Scope	NOTE: GenAI excluded (	PASS: All AI in scope	HIGH
OVERALL	ESCALATE	ESCALATE	—

What the Platform Does NOT Do

Macroeconomic stress scenarios

The platform monitors model stability through PSI. It does not simulate portfolio performance under a recession or interest rate shock.

That requires integration with DBS's internal stress-testing infrastructure and MAS's Financial Stability Review scenario data — *a separate build, correctly owned by a different team.*

Basel III capital model validation

A separate regulatory track with different supervisory channels (prudential vs conduct/AI).

Mixing it into this tool would make both functions harder to audit. Not in scope for v1.

GenAI governance under the US regime

This is consistent with OCC 2026-13's explicit exclusion of generative AI and agentic AI from its scope. To include GenAI in the US config would misrepresent the current US regulatory position. When OCC issues separate GenAI guidance — and a separate RFI is forthcoming — we will add a config for it. *The Singapore config already covers all AI.*

Real-time scoring

The platform is a **batch assessment tool**. Real-time governance requires streaming integration and a different latency budget. Correctly scoped as a second build.

- **What this means for the paying client:**

These are not apologies. They are the design decisions that make the tool's actual scope trustworthy. *A tool that claims to do everything is a tool whose outputs cannot be relied upon for anything.*

Why ClearPath Is Right for This

The competitive position

ClearPath is not competing with DBS's data science team, with consulting firms, or with general-purpose GRC platforms. We are solving the specific, unglamorous problem that none of those actors have solved: **translating regulatory prose** (written in legal language, updated unpredictably, diverging across jurisdictions) **into operational checks that run automatically against model outputs.**

Why this is harder

The challenge is not building metrics. It is **knowing which metrics a Singapore MAS examiner expects** versus a US OCC examiner — and encoding that difference into a system that keeps itself current when the rules change. Our version-controlled *JurisdictionConfig* architecture is the core intellectual product.

What we measure our value in

Not dashboards, not audit trails, not sign-off records.

Examination readiness: When a MAS or OCC examiner asks *"how did you assess this model under current guidance?"*, the answer is a version-stamped report with a named regulatory reference, not a spreadsheet someone found on a shared drive.

Central argument, made operational

RegTech tools are political artefacts. OCC and MAS have made different political choices about how much consumer protection to require and how much burden to place on banks. A governance tool that applies one country's rules to both jurisdictions is not neutral — it takes a side. ClearPath surfaces the divergence explicitly and routes it to the humans who have the authority to decide what to do about it.

Thank you for listening!
